

NON-AUTHORITATIVE CONTEXT z_t

May condition a proposal: cannot directly mutate canonical state

Retrieval / memory

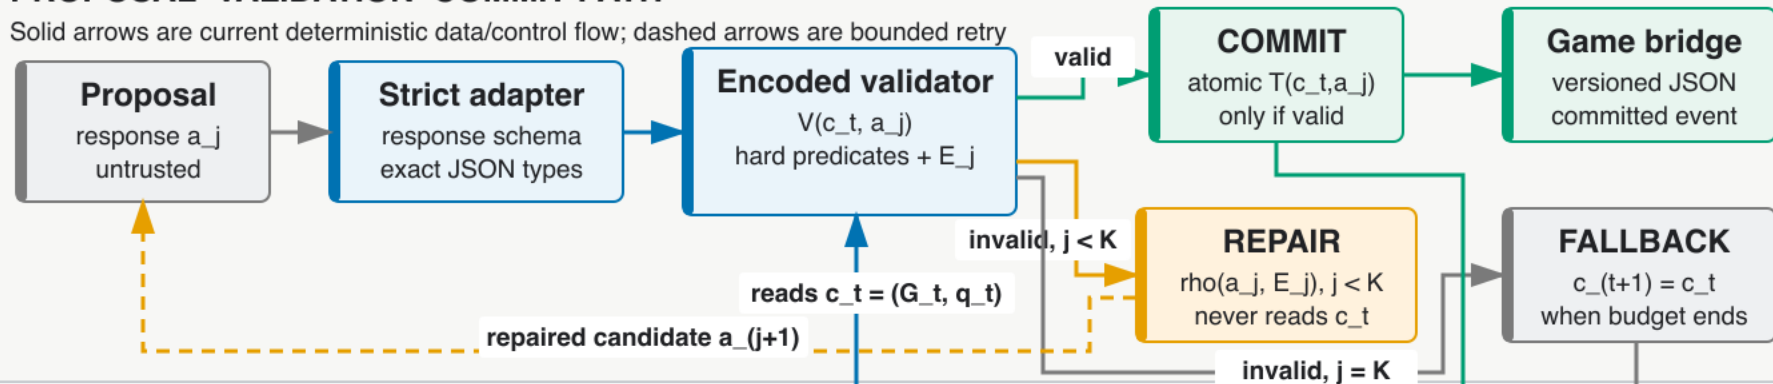

Soft narrative scores

Model rationale

Future affect estimate

PROPOSAL-VALIDATION-COMMIT PATH

Solid arrows are current deterministic data/control flow; dashed arrows are bounded retry

CANONICAL AUTHORITY $c_t = (G_t, q_t)$

Canonical owner supplies typed world state and stored policy; record history $h_{(<t)}$ is kept separately and is never read by validation

Prior canonical state c_t

Externally supplied policy q_t

Final canonical state c_{t+1}
